ABSTRACT

The Hampton Roads Transportation Planning Organization (HRTPO) is currently in the process of updating the regional Long-Range Transportation Plan to the horizon year 2040. As part of this process and in keeping with federal regulations, HRTPO staff must examine how the region may develop over the next 20 years based upon projected population and employment growth. To accomplish this task, staff developed socioeconomic control totals for each locality in the region, which were then allocated to Transportation Analysis Zones (TAZs). This data will be used in the region's travel demand model in the development of the 2040 LRTP.

ACKNOWLEDGEMENTS

This document was prepared by the Hampton Roads Transportation Planning Organization (HRTPO) in cooperation with the U.S. Department of Transportation (USDOT), Federal Highway Administration (FHWA), Federal Transit Administration (FTA), Virginia Department of Transportation (VDOT), Virginia Department of Rail and Public Transportation (DRPT), Transportation District Commission of Hampton Roads (TDCHR), and Williamsburg Area Transit Authority (WATA). contents of this report reflect the views of the HRTPO. The HRTPO staff is responsible for the facts and the accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of the FHWA, FTA, VDOT or DRPT. This report does not constitute a standard, specification, or regulation. FHWA, FTA, VDOT or DRPT acceptance of this report as evidence of fulfillment of the objectives of this program does not constitute endorsement/approval of the need for any recommended improvements nor does it constitute approval of their location and design or a commitment to fund any such improvements. Additional project level environmental impact assessments and/or studies of alternatives may be necessary.

NON-DISCRIMINATION

The HRTPO assures that no person shall, on the ground of race, color, national origin, handicap, sex, age, or income status as provided by Title VI of the Civil Rights Act of 1964 and subsequent authorities, be excluded from participation in, be denied the benefits of, or be otherwise subject to discrimination under any program or activity. The HRTPO Title VI Plan provides this assurance, information about HRTPO responsibilities, and a Discrimination Complaint Form.

Hampton Roads 2040 Socioeconomic Forecast and TAZ Allocation

The Hampton Roads Transportation Planning Organization (HRTPO) is currently in the process of updating the regional Long-Range Transportation Plan to the horizon year 2040. As part of this process and in keeping with federal regulations, HRTPO staff must examine how the region may develop over the next twenty years based upon projected population and employment growth. To accomplish this task, staff developed socioeconomic control totals for each locality in the region, which were then allocated to Transportation Analysis Zones (TAZs). This data will be used in the region's travel demand model in the development of the 2040 LRTP.

Hampton Roads 2040 Socioeconomic Forecast and TAZ Allocation

PURPOSE

The primary purpose of a forecast is to improve the decision making process in matters that have future implications. Large and costly infrastructure projects that are designed for current and future use are a prime example of the need for forecasting.

According to Federal regulations (23CFR450.300 –Metropolitan Transportation Planning and Programming: Purpose),¹ the Metropolitan Planning Organization (MPO) of each designated urbanized area should “carry out a continuing, cooperative and comprehensive multimodal transportation planning process, including the development of a metropolitan transportation plan and a transportation improvement program (TIP).”²

Further, as per 23CFR450.322, the metropolitan transportation plan should have a minimum 20-year planning horizon and should include both “long-range and short-range strategies/actions that lead to the development of an

¹<http://www.fhwa.dot.gov/hep/guidance/superseded/23cfr450.cfm#sec.450.320>

² www.gpo.gov/fdsys/pkg/CFR-2011-title23-vol1/pdf/CFR-2011-title23-vol1-part450-subpartC.pdf

Regional Overview

Hampton Roads is home to more than 1.7 million residents and is projected to grow to almost 2 million by the year 2040. The region is among the 40 largest Metropolitan Statistical Areas in the country, and the sixth largest in the Southeast.

integrated multimodal transportation system”.³ The MPO must review and update the transportation plan at least every four years in air quality nonattainment and maintenance areas. The plan at a minimum should include “the projected transportation demand of persons and goods in the metropolitan planning area over the period of the plan.”

The current metropolitan transportation plan (2034 Long – Range Transportation Plan) was adopted by the Board of the Hampton Roads Transportation Planning Organization (hereon referred to as the HRTPO) in January 2012. The Long-Range Transportation Plan (LRTP) serves as the blueprint for the region’s transportation development and identifies all regionally significant transportation projects for the Hampton Roads metropolitan area.

Upon completion of the 2034 LRTP, the HRTPO has begun to update the transportation plan to the horizon year of 2040. As part of the process and in keeping with the federal regulations listed above, HRTPO staff must examine how the region may develop over the next 20 years based upon projected population and employment growth. Changes in growth can impact demand on the regional transportation system, therefore future plans must consider alternatives to effectively address these needs. Once alternatives are determined, funds are then identified to cover the costs of these future transportation investments.

This first step in preparing the 2040 LRTP is to conduct a long-range socioeconomic forecast with which to populate the

³<http://www.fhwa.dot.gov/hep/guidance/superseded/23cfr450.cfm#sec.450.322>

regional travel demand model.⁴ Model requirements call for the forecast of several elements, including:

- Population
- Households
- Number of workers
- Passenger vehicle registrations
- Employment by place of work by categories
 - Retail
 - Industrial
 - Office
 - Other

These model inputs are then used to assist in the planning for, and analysis of, regional transportation projects.

The regional socioeconomic forecast is the result of significant effort that includes extensive research, modeling & analysis, as well as substantial input from member localities. The process for developing the forecast is monitored by the Long-Range Transportation Planning Subcommittee as well as the Transportation Technical Advisory Committee (TTAC) and requires the approval of the HRTPO Board. Once the forecast has been completed and approved, it is often used by member localities and other regional agencies to assist in their planning efforts.

⁴ The HRTPO Travel Demand Model (TDM) is a planning tool developed by the Virginia Department of Transportation (VDOT) to forecast and analyze transportation scenarios in Hampton Roads.

INTRODUCTION

Forecasting⁵ involves making a statement about an event that has not yet been observed, and is typically at a future specified date. The inherent difficulty in making an accurate forecast is accounting for unknown variables that can influence an event. This is especially true for long-range forecasts, where the number of unknown variables increases over time. Long-range forecasts remain necessary, however, as it is important to plan for the future when making a significant investment of resources.

This report will explain the process and the methodology used to develop the *Hampton Roads 2040 Socioeconomic Forecast* and provide the forecast data that will be serve as an input for the HRTPO's Travel Demand Model (TDM).

METHODOLOGY

The development of the *Hampton Roads 2040 Socioeconomic Forecast* began with a comprehensive review of forecasting techniques and a review of best practices from other Metropolitan Planning Organizations.

At the outset, it was evident that there are numerous techniques generally used in forecasting. Quantitative forecasts are typically based on historical data and use mathematical formulas for trend extrapolation, cohort component analysis, or structural models. Quantitative methods range from simple linear projections, to autoregressive moving average (ARMA or

ARIMA) models, to advanced econometric and spatial models. There are also qualitative forecasts that can be based on informed opinion (the Delphi Method), market research, and other non-numerical inputs. The type of forecasting technique utilized in a projection process is typically dependent on a variety of factors, such as data availability, project scope, consistency of historical trends, and the availability resources (Smith, Tayman, Swanson 2001, 5). According to research, forecast accuracy tends to increase with population size, increase with slow and steady positive growth rates, and decrease over longer durations. Research also suggests that no forecasting technique consistently out-performs other techniques; as such, there is no single technique that is deemed superior to all others.

Given the variability of forecasting techniques, a literature review was conducted to determine current best practices in long-range forecasting from other MPOs. Once again it became evident that there were numerous different approaches employed by MPOs in the development of long-range forecasts. Several MPOs conducted their own forecasts, some relied on the state to provide their forecast, and others contracted with private companies or universities to develop their forecast. While there was very little in the way of consistency, some notable trends did appear. Many MPOs relied on comprehensive plans in the development of their forecasts, resulting in scenario based results rather than purely model driven results. In the event that scenario based forecasts were employed, forecasts tended to be restricted to base and horizon years, avoiding intermediate years. Listed below are a few highlights from long-range forecasts for select MPOs, a

⁵ Projections are statements about the future based on a particular set of assumptions, whereas a forecast is what an analyst believes to be most likely to provide an accurate prediction of future events (Smith, Tayman, Swanson 2001, 3).

testament to some of the diversity and similarities in forecast methodology:

Seattle – Puget Sound Regional Council

- Employed an UrbanSim model developed by the University of Washington that focused on the real estate market, the transportation system, development patterns, travel demand, and household and firm locations.

San Francisco Bay Area Regional Transportation Plan

- Long range forecast utilized policy-based development potential to determine growth, ensuring the forecast was consistent with comprehensive plans.

Chicago Metropolitan Agency for Planning

- Scenario-based forecasting dependent on current population and land use trends, using mathematical modeling techniques to distribute population and employment.

Metropolitan Washington Council of Governments

- Employed a top-down, bottom up approach, using a regional model based on national economic and demographic factors to determine potential growth for the region, while relying on cooperation among local governments to determine potential growth at the local level.

Portland – Oregon Metro

- Relied on a GIS based model populated with data from the Regional Land Information System.

Boston – Metropolitan Area Planning Council

- Metro area forecast was provided by the state department of transportation.

Kansas City: Mid-America Regional Council

- Employed a qualitative forecasting approach based on informed opinion from technical committee members.

Atlanta Regional Commission

- Forecast was derived using REMI (Regional Economic Models, Inc), an advanced econometric modeling tool.

Southeast Michigan Council of Governments

- Forecast was developed by the University of Michigan through use of the UrbanSim model.

Delaware Valley Regional Planning Commission

- Utilized three different forecasts, based on cohort-component and trend extrapolation, to provide a minimum and maximum growth estimate.

San Diego Association of Governments

- Employed a top-down, bottom up method, developing regional control totals with which to constrain local forecasts.

After conducting a literature review, and researching best practices of other metropolitan planning organizations, staff prepared a draft methodology and presented it to the Transportation Technical Advisory Committee. The approved methodology consisted of a multi-step process specifically tailored to the Hampton Roads region that incorporated several aspects from forecasts developed in MPOs across the nation.

The forecast methodology employed a top-down, bottom up approach, determining growth for each dataset at the regional level to serve as a constraint for the combined growth rates of each of the individual localities. Given the region's unique attributes, two separate forecasts were used. One for the Southside of Hampton Roads, consisting of the Cities of Chesapeake, Franklin, Norfolk, Portsmouth, Suffolk, and Virginia Beach, and the Counties of Isle of Wight, Southampton, and Surry.⁶ The other sub-regional forecast is for the Hampton Roads' Peninsula, consisting of the Cities of Hampton, Newport News, Poquoson, Williamsburg, and the Counties of Gloucester, James City, and York.

The regional and sub-regional control totals were developed using the Hampton Roads Planning District Commission's REMI (Regional Economic Modeling, Inc.) model.⁷ The REMI model is one of the most advanced and sophisticated dynamic

forecasting and policy analysis tools available on the market, widely recognized for quality, accuracy, and integrity.

The REMI model is an especially valuable tool for long-range forecasting in that its dynamic structure enables the user to simultaneously forecast industry employment along with population, ensuring internal consistency in the forecast. The model is driven primarily by projected employment, using short-term forecasts from the University of Michigan's Research Seminar in Quantitative Economics (RSQE), and long-term projections from the Bureau of Labor Statistics (BLS). Predicating long-term population growth on expected changes in employment is strongly supported by literature because employment influences variable migration patterns, whereas natural growth rates (births and deaths) tend to be stable and consistent (Smith, Tayman, Swanson 2001, 188-9). An illustration of the REMI model structure (Figure 1) is included on the following page.

⁶ Although Franklin, Southampton, and Surry are not part of the MPO, they are within the boundaries of the Hampton Roads Planning District Commission; Franklin and Southampton maintain seats on the HRTPO Board in matters that involve funding from the Hampton Roads Transportation Fund (Virginia House Bill 2313, 2013).

⁷ Information about the REMI model, including the assumptions, equations, and detailed specifics of the model are available at www.remi.com/resources/documentation - PI+ version 1.3

FIGURE 1: REMI MODEL STRUCTURE

In order to ensure that the most recent information was used in the development of the forecast, the HRPDC REMI model was updated with the latest information from the U.S. Census Bureau and the Bureau of Economic Analysis (BEA).

The long-range population forecast figures derived through the REMI model provide estimates of the components of population change, using employment projections to develop estimates of migration, while utilizing cohort-component survival analysis to forecast age and gender estimates for the residents of Hampton Roads.

FIGURE 2: COMPONENTS OF POPULATION CHANGE

FIGURE 3: HAMPTON ROADS POPULATION HISTOGRAMS

In order to better understand the components of travel demand, the Virginia Department of Transportation (VDOT) divided the employment by place of work category into four super-sectors, namely Retail, Office, Industrial, and Other. These four sectors were categorized by VDOT according to industries as defined by the North American Industrial Classification System. The employment breakdown is illustrated in Figure 4 below.

FIGURE 4: EMPLOYMENT BREAKDOWN FOR HAMPTON ROADS TRAVEL DEMAND MODEL

Industry Sector	2-Digit NAICS*	Retail	Office	Industrial	Other
Agriculture, Forestry and Fisheries	11			100%	
Mining	21			100%	
Construction	23		10%	90%

* North American Industrial Classification System

Source: VDOT Hampton Roads Model Methodology Report

The REMI model was used to forecast employment growth for each of the four super-sectors, based on projected employment trends.

FIGURE 5: HAMPTON ROADS EMPLOYMENT PROJECTS BY SUB-GROUP

The top-down aspect of the projection was developed only for the population and employment components of the forecast, as the remainder of the forecast categories (number of workers, households, and passenger vehicle registrations) would be dependent on development patterns within the individual localities.

The bottom-up forecast for the localities was developed in two stages. The first stage required a complete understanding of the development assumptions for each of the localities, as is consistent with scenario-based forecasting. To gain an understanding of expected development patterns, staff reviewed each of the locality's Comprehensive Plans and met with planning staff from all sixteen jurisdictions to ensure a full

understanding of the current expectations and assumptions regarding future development. As development does not take place in an even and consistent manner across the region (development horizons may be 5, 10, or 15 years out), the decision was made to forecast only the horizon year and not the intermediary years.⁸

Guided by the information provided by the planning department of each locality, jurisdiction specific forecasts were developed by combining scenario based forecasting with trend extrapolation. Various trend extrapolation techniques were used, depending on the development patterns assumed by each locality. Undisclosed data from the Virginia Employment Commission, the Bureau of Labor Statistics, and the Bureau of Economic Analysis was used in the development of each of the locality projections. The cumulative employment and population totals for the localities were aligned to fit into the regional and sub-regional control totals, thus completing the top-down, bottom up forecast.

In order to determine the estimated number of households for each locality, staff relied on analysis purchased from Woods & Poole Economics, an independent firm based out of Washington D.C. that specializes in long-term county economic and demographic projections. The forecast for households was determined by holding constant the current institutionalized population and dividing the remainder of the population by the

Woods & Poole forecast for the projected number of persons-per-household for each locality.

FIGURE 6: PERSONS PER HOUSEHOLD

⁸ Intermediary estimates are often provided when pure mathematical models are employed as the forecasting technique. Unlike purely mathematical models, scenario based forecasts can recognize that change may not take place in a consistent manner.

The forecast for the number of workers by locality was dependent on each locality's population forecast and by the relationship that currently exists between population and workers within each locality.

Whereas the number of workers was determined to be dependent on population growth, the forecast for the number of vehicle registrations was based on the projected number of households. It is difficult to forecast, with a great deal of certainty, whether the number of vehicles per household will increase in the future, decrease, or remain constant. The Center for Automotive Research forecasts that the number of vehicles per household will level out to 2.07 vehicles by 2025. For the purpose of this forecast, localities that currently had less than 2.07 vehicles per household were projected to increase to 2.07 by 2040, whereas localities with high rates of vehicle ownership were held constant.

An explanation of the methodology along with the completed draft control totals for each locality was presented to the Long-Range Transportation Subcommittee in September of 2012 and to the Transportation Technical Advisory Committee (TTAC) in October of 2012. The control totals were sent out for public review through October of 2012 and recommended for approval by TTAC in November 2012. At its monthly meeting in November, the HRTPO board unanimously approved the locality control totals.

FIGURE 7: VEHICLES PER HOUSEHOLD

Source: Center for Automotive Research

Once the control totals had been formally adopted by the HRTPO Board, each jurisdiction was charged with assigning the 2040 forecast data to the transportation analysis zones (TAZs) within the locality.

TAZ ALLOCATION

The next step in the forecasting process was to allocate forecasted control totals to TAZs, the base geographical unit of analysis for the travel demand model. Hampton Roads is comprised of approximately 1,500 TAZs. Socioeconomic data was allocated to this level to estimate traffic volumes and patterns in an effort to identify current and future deficiencies in the transportation network. These results can be used to identify where road improvements are needed within the region.

As part of the allocation process, control totals for *Households*, *Total Employment*, *Retail Employment*, *Office Employment*, *Industrial Employment*, and *Other Employment* were distributed to each jurisdiction. Staff from each locality allocated these control totals to their respective TAZs. HRTPO staff then utilized these TAZ allocations to calculate the remaining socioeconomic TAZ totals for *Population*, *Passenger Vehicles*, and *Workers*.

FIGURE 8: TRANSPORTATION ANALYSIS ZONES

Transportation analysis zones (TAZs) are the base geographical unit of analysis for the travel demand model.

Travel Demand Model

An important analysis tool in transportation planning is the travel demand model. The travel demand model is a computer program designed to simulate travel. The model uses socioeconomic data (households, population, auto ownership, workers, and employment) to estimate traffic volumes and patterns in an effort to identify current and future deficiencies in the transportation network.

Traditional travel demand models use a four-step process:

Trip Generation produces estimates of trip productions (origins) and trip attractions (destinations) by trip purpose (going to work, school, shopping, etc.). Trip Distribution determines where the trips are traveling from and to. Mode Choice decides by what mode the trips will be made (car, bus, light rail, carpool, etc.). Finally, Trip Assignment determines the best route the vehicle trips will take.

Results from the travel demand model are used in the Project Prioritization Tool and the LRTP to help identify where transportation improvements are needed within the region.

Note: ¹ MPA - Metropolitan Planning Area: 12 Hampton Roads Localities plus southern Gloucester County.

² Regional Modeling Area: 13 Localities (including all of Gloucester County)

The data in the table above reflects the data used in the validation of the region's travel demand forecasting model.

Workers are defined as workers-at-residence, whereas employment is defined as jobsite employment.

In September 2010, the US Census Bureau released the American Community Survey (ACS) 2009 1-year population estimates. These figures may differ from the 2009 data in the above table as the ACS figures were not available by TAZ at the time the 2009 numbers were developed (November 2010).

2009 AND 2040 SOCIOECONOMIC DATA BY TAZ

MAP 9: CHESAPEAKE TRANSPORTATION ANALYSIS ZONES

CHESAPEAKE
2009 AND 2040 TAZ DATA

NOTES: TAZ's with "N/P" in the employment column cannot have their 2009 employment data disclosed due to VEC regulations.
Data is sorted by TAZ number.

CONCLUSION

As mentioned at the outset of this report, making an accurate long-term forecast is inherently difficult because the future contains many unknowns that will influence demographic trends and behaviors. This inherent difficulty, however, does not abdicate one from the responsibility to plan and prepare for the future in the most efficient manner possible. This forecast was prepared in an unbiased manner, based on a sound and reasoned methodology, using the best information currently available. As future unknowns begin to unfold, unexpected shifts in demographic trends will take place. In recognition of the ever-changing environment in which we live, the HRTPO will provide continuous updates to the socioeconomic forecast, and to the region's Long-Range Transportation Plan.
